

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

vestigates a formula geometrically, to express the ellipticity in terms of such difference; and thus by accurate observations of Foucault's pendulum in different parts of the earth, he conceives the ellipticity might be determined.

As an instance, he cites Foucault's result for the latitude of Paris; which differs by a small amount from the formula, and which he considers accordingly to express the ellipticity, though he does not calculate it.

2. "On the Extension of the value of the Base of Napier's Logarithms; of the Napierian Logarithms of 2, 3, 5, and 10; and of the Modulus of Briggs's, or the Common System of Logarithms; all to 205 places of decimals." By William Shanks, Esq. Communicated by G. B. Airy, Esq., Astronomer Royal, F.R.S. &c. Received January 21, 1854.

The author, after referring to the value of  $\pi$  to 527 decimals computed by him and printed in the 'Proceedings,' for January 20, 1853, states that he has very recently extended and computed the values which form the subject of this communication to 205 places of decimals; and as very great care has been taken to exclude error, it is presumed there exist reasonable grounds for pronouncing them quite accurate. At the same time it should be distinctly understood, that *no direct check or proof* has yet been applied to the values in question. He states that the formulæ employed in finding these logarithms, are investigated by Mr. J. R. Young, in his 'Elementary Essay on the Computation of Logarithms,' pp. 13 and 14, and he considers that no better formulæ than these have yet been published for readily computing, *to a great extent*, the Napierian logarithms of 2, 3, 5, 7, &c.

Subjoined are the values referred to:—

#### Base of Napier's Logarithms =

27182818	2845904	5235360	2874713	5266249

0000626	1111154	1362298	9315024	24+&c.

## Napierian Logarithm of 5 =

16094379	1243410	0374600	7593332	2618763
9525601	3542683	1772191	2646780	8257554
5759268	0738412	2078288	5798574	2982618
5124170	8082338	1773353	3644800	7430691
6314333	5570584	1878072	7874564	5612567
3804931	0408586	1451680	3463508	54 + &c.

## Napierian Logarithm of 10 =

13025850	9299404	5684017	9914546	8436420
7601101	4886287	7297603	3326304	4104637
8513707	3005047	7285093	1400711	3354530
3350481	2381057	6355463	4093686	9182209
1415335	9829761	8312394	5299109	9105717
7784979	7747709	8399376	1744515	35 + &c.

## Modulus of Common System of Logarithms =

4342944	8190325	1827651	1289189	1660508
2294397	0058036	6656611	4454084	2952103
2050138	9388912	2047096	6953461	1420043
3938056	4705613	4312230	2306044	2927744
1521725	4737266	8184290	1672329	4707564
5865061	2932207	5502468	4291564	99 + &c.

The foregoing values are, it is presumed, correct to the last figure inclusive.

---

February 9, 1854.

SIR FREDERICK POLLOCK, M.A., V.P., in the Chair.

A paper was in part read, entitled "Further researches into the properties of the Sulphate of Iodo-Quinine or Herapathite, more especially in regard to its Crystallography, with additional facts concerning its optical relations." By William Bird Herapath, M.D. Communicated by Golding Bird, M.D., F.R.S. Received Jan. 27, 1854.

---

February 16, 1854.

COLONEL SABINE, R.A., Treas. and V.P., in the Chair.

Joseph Beete Jukes, Esq., was admitted into the Society.

The reading of Dr. Herapath's paper was resumed and concluded.

After referring to the observations of Professors Stokes and Haidinger, as well as to papers already published by himself on this subject in the Philosophical Magazine, the author gives an account of a set of prisms perfectly complementary in their optical characters to those previously described by him, and proves this fact by an elaborate comparison of their various optical relations; from which it appeared, that whilst the  $\alpha$ -prisms (those described in Philosophical Magazine for March 1852) were totally impervious to a beam of polarized light, reflected from glass plates, when the plane of the length of the prism was at right angles to the plane of primitive polarization, the  $\beta$ -prisms (those now examined) were equally ab-
